I would like to know what is the input voltage rating of this 4.3VDC 3A LDO +24VDC and -24VDC power supply. I wanted to use them with my project. Can anyone explain it to me? A: That one looks like a simple linear regulator. If we have this graph of output voltage vs. input voltage, we can see that the regulator can accept voltages up to 24V. This means its input can accept 24V up to 24V. 4.3V needs minimum 10V input so no matter what the input is, the output will be 4.3V. When the input voltage is lower than 10V, the output will follow the input with a slight drop. When the input is below 4.3V, the regulator shuts off completely. If you really need high output voltage at low input voltage, the regulator you linked is not the correct one. A few days ago, I wrote a short post about Hiddleston and a photograph he had taken of himself running down a Berlin street. I suggested that it might be a good idea for him to have some kind of website, with the primary purpose of displaying his stunning photographs. You may have clicked through, and I have read a few comments in the comment section, but I did not mean this
